SCIENTIFIC RATIONALE

Precision medicine is becoming a challenge and a promise in oncology. The detailed knowledge of molecular mechanisms of cancer is identifying new druggable targets and is generating new highly selective molecularly targeted agents. The hope that tumours can be cured by customised treatment according to their genetic and molecular make-up is becoming a reality in adult oncology. This international symposium will provide an overview of the recent updates on precision medicine in pediatric oncology. Internationally known experts will discuss this exciting scenario through lectures and a round table on how to make this a reality also for children with cancer.
